

Micro

Small in size, big in performance

A revolutionary structure for an extremely compact internal volume, never achieved before.

The MICRO MASK is characterised by a completely revolutionary, patented structure that makes it possible to insert the mask lenses into the ocular orbit thereby obtaining an extremely compact internal volume.

The patented double joint buckles (cardan joint buckles) rotate both up-and-down and inwards-and-outwards. They provide maximum adaptability to any head shape.

The excellent field of vision, along with the very compact internal volume, makes the Micro Mask a favourite choice among all divers.
